Let $\mathbb{C}$ be the category whose objects are complexes of $\mathbb{C}$-modules and whose morphisms are chain maps. I am not sure how to define the composition of morphisms. I read a post on the web which says: Let $X^\bullet$ be a complex of $\mathbb{C}$-modules and let $Z^\bullet$ be a complex of $\mathbb{C}$-modules and define $Z^\bullet \circ X^\bullet$ to be the complex given by $(Z^\bullet \circ X^\bullet)_n = \sum_{k+l=n} Z^k \circ X^l$. So if $Z^\bullet = \bigoplus_{i=1}^\infty Z^i$ then $Z^\bullet \circ X^\bullet = \prod_{i=1}^\infty (\oplus_{k=0}^i Z^k)$. My question is, how do we know that $Z^\bullet \circ X^\bullet$ is well defined? I thought that if $X^\bullet$ and $Y^\bullet$ are chain maps then so are $Z^\bullet \circ X^\bullet$ and $Z^\bullet \circ Y^\bullet$. But it seems that we need to show this in two steps: first show that $\prod_{i=1}^\infty (\oplus_{k=0}^i Z^k)$ and $\prod_{i=1}^\infty (\oplus_{k=0}^i Y^k)$ are chain maps, then show that they are chain maps. The most natural definition of a composition of two morphisms in $\mathbb{C}$ is the derived tensor product. I think that when we define the derived tensor product we don't need to show that $
